# CONTENTS

## 1 INTRODUCTION

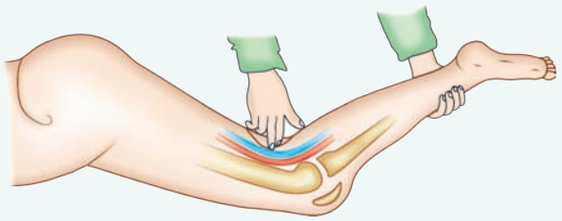

Instruments used during dissection 1; Methods of embalming of dead body 3; Tricks for meticulous dissection 3; Difference between window dissection and identification 5; Positioning of body and terminology of body regions 5; Positioning (body posture) 5; Anatomical terms 5; Regional terms for specific body areas 6.

## 2 THE UPPER LIMB SUBDIVISIONS

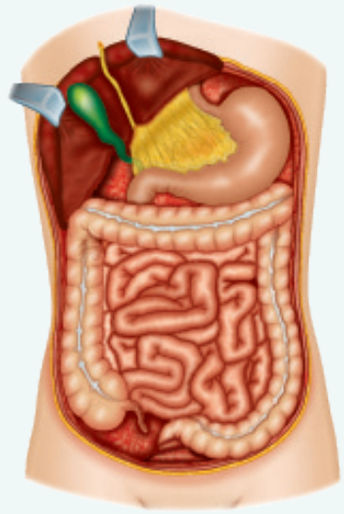

Front of upper limb 8; Clavipectoral fascia 8; Incision 8; Steps of dissection 9; Applied anatomy 10; Axilla 11; Position of body during dissection—supine with upper limb at right angle with the body 12; Dissection procedure and contents of axilla 12; Muscles in this region 14; Applied anatomy (clinical anatomy) 14; Cubital fossa 16; Position of body during dissection 16; Incision 17; Steps of dissection 17; Applied 18; Palm 18; Position of body 19; Incision 19; Clinical anatomy 21; Midpalmar space and thenar space 21; Infection of the pulp space of the finger 22; Carpal tunnel syndrome 22; Front of arm 22; Incision 23; Dissection procedure and contents of arm 23; Bone of this region—humerus 24; Front of forearm 25; Steps of dissection and contents 25; Bones of forearm are radius (on lateral side) and ulna (on medial side) 28; Muscles of forearm 28; Triangular and quadrangular space (scapular region) 28; Clinical anatomy 32; Back of upper limb 32; Posterior compartment of arm 32; Position of body 32; Incision 32; Steps of dissection and identification of structure 32; Back of forearm with dorsum of hand 34; Contents 34; Muscles 34; Position of the body 35; Incision 35; Steps of dissection and identification of structures 35; Bones of the region 37; Shoulder joint (glenohumeral joint) 39; Bones concerned 40; Steps of dissection and identification of structures 40; Movements of the joint 40; Clinicial anatomy 42; Viscera (upper limb) and thorax 43; Breast 43.

# 3 THE LOWER LIMB SUBDIVISIONS

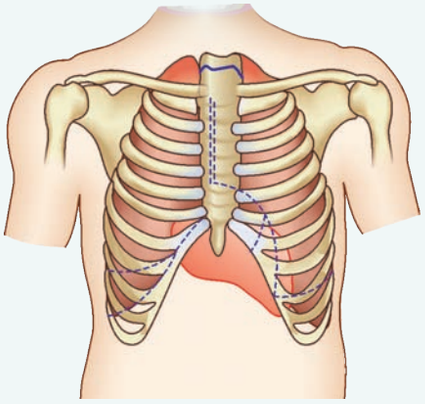

Inferior extremity (front) 47; Femoral triangle 47; Position of body 47; Steps of dissection 47; Applied (clinical) anatomy 51; Name of the dissection—adductor canal and front of thigh 51; Position of the body—supine, with thigh slightly abducted and rotated laterally 51; Steps of dissection and identification of structures 52; Incisions 52; Clinical anatomy 53; Dissection of leg (anterolateral compartment) 53; Position of body 53; Incisions 54; Bones of this region 55; Tibia and fibula 55; Muscles of this region 56; Muscles of anterior compartment of leg 56; Applied (clinical) anatomy 56; Name of the dissection— dorsum of foot 57; Position of body—supine with slight plantar flexion of foot 57; Incisions 57; Steps of dissection and structures identified in this region 58; Bones of this region are articulated skeleton of foot (dorsal aspect) 59; Applied anatomy 59; Inferior extremity (back) 61; Name of the dissection—gluteal region 61; Incisions 61; Steps of dissection and identification of structures 63; Bones of gluteal region 64; Hip bone, sacrum, coccyx and femur 64; Main muscles of the gluteal region 65; Applied anatomy 65; Popliteal fossa 67; Position of body—prone with extended knee 67; Incisions 67; Steps of dissection and identification of structures 67; Applied anatomy 68; Name of dissection—back of thigh 69; Position of the body—prone with extended thigh and knee 69; Steps of dissection and identification of structures 70; Incisions 70; Applied anatomy 71; Back of leg 72; Position of body—prone with extended knee 72; Steps of dissection and identification of structures 73; Incisions 73; Bones of the back of leg are posterior surface of tibia and fibula 74; Applied (clinical) anatomy 75; Sole 76; Steps of dissection and identification of structures 76; Incisions 76; Bones of this region are articulated skeleton of foot 77; Applied (clinical) anatomy 77; Hip joint 78; Movements of the joint, muscle involved, and nerve supply 80; Applied anatomy 81; Knee joint 82; Steps of dissection and identification of structures 82; Applied anatomy 85; Questions on faced during window dissection and identification 86; Lower limb 86; Adductor canal and front of thigh 87; Anterolateral crural region 87; Gluteal region 88; Back of thigh 88; Popliteal fossa 88; Back of leg 89; Sole 89; Dorsum of foot 89.

# 4 ABDOMEN

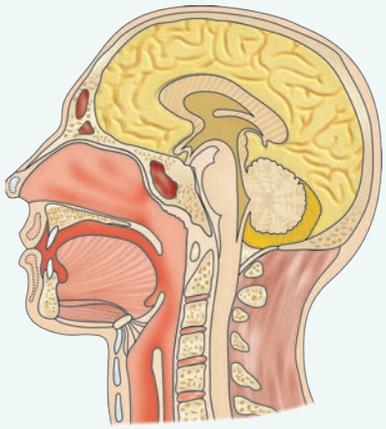

Name of the dissection—inguinal canal 90; Steps of dissection and identification of structures 90; Incisions 90; Rectus sheath 92; Position of body—supine with thigh extended 92; Formation of rectus sheath 94; Opening up of abdominal cavity 94; Position of body—supine 94; 1st day 94; Study of peritoneum and its cavity 95; Peritoneal folds 96; Peritoneal compartments 98; Peritoneal gutters 99; Applied anatomy 99; 4th day 99; 5th day 100; 6th day 103; 7th day 104; Lumbar plexus and its branches 105; Branches come out from the medial border of psoas major 105; Dissection of pelvis 106; Internal iliac artery (right and left) and its branches 106; Sacral plexus and its branches 108; Perineum (window dissection) 108; Boundary 108; Urogenital triangle 110; Anal triangle 112; Duodenum, jejunum and ileum 114; Large intestine 116; Important features (cardinal features) 116; Genitourinary system 120; Female reproductive system 123; Male reproductive system 124; Abdomen 125; Rectus sheath 126; Peritoneal cavity 126; Superior mesenteric artery 126; Celiac trunk and portal vein 126; Inferior mesenteric artery and abdominal aorta 126; Structures of posterior abdominal wall 127; Internal and external iliac arteries and interior of pelvis 127.

# 5 THORAX

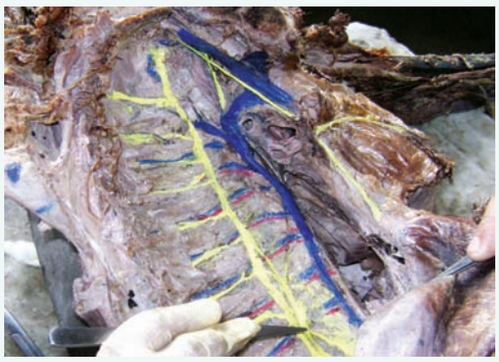

Intercostal space 128; Branches 129; Deep muscles of thorax 129; Opening of cavity of thorax 131; Pleural cavities 132; Visceral pleura 133; Nerve supply 133; Recesses of pleura 133; Applied (clinical) anatomy 133; Right side of thoracic wall 133; Sympathetic trunk 133; Left side of thoracic wall 134; Mediastinum 134; Pericardial cavity 135; Lungs 137; Applied anatomy 140; Important notes 140; Heart 140; Introduction 140; Artery supply of heart (coronary circulation) 143; The diaphragm 144; Thorax 145; Intercostal space and internal thoracic artery 145; Thoracic cavity (right side) 145

# 6 HEAD AND NECK

Name of the dissection—face 146; Position of body (supine) 146; Identification 146; Steps of dissection and identification of structures 147; Incisions 147; Bones of this region are: frontal, maxilla, zygomatic, nasal, ethmoid, mandible and parietal 148; Removal of skull cap and study of dural venous sinuses and roots of cranial nerves 148; Dural venous sinuses 151; Study the cranial nerves and base of the skull 152; Name of dissection—anterior triangle 158; Position of body (supine with neck extended) 158; Identify the following structures in this region 158; Steps of dissection and identification of contents 158; Incisions 158; Find out the floor 160; Name of dissection—posterior triangle 161; Position of body (supine with neck turned towards opposite side) 161; Steps of dissection and identification of structures 162; Incisions 162; Infratemporal fossa 163; Steps of dissection and identification of structures 164; Muscles of this region 164; Muscles of mastication 167; Viscera of head and neck 168; Brain 174; White matter of cerebral hemisphere 179; Questions from identifications and window dissection from head, neck and face 184; Anterior triangle of neck 184; Posterior triangle of neck 184; The cranial cavity 185; Infratemporal fossa 185.

# 7 SECTIONAL ANATOMY

The importance of sectional anatomy 186; How to preserve cadavers for sectional anatomy 186; Middle 1/3rd section of arm or forearm thigh or leg means we see the section at the region of upper 1/3rd and lower 2/3rd part 187; Cross-section of left leg at the level of upper 2/3rd and lower 1/3rd junction—as the same section is turned upside down—so the orientation of tibia and fibula has changed 191.

# INDEX 207
