Contents

SECTION ONE: UNDERSTANDING THE DIABETIC FOOT

1. Introduction 3
   Triple jeopardy Neuropathy, Ischemia, Infection
2. Gait (Walking) Cycle 5
   Learning to Walk is *Child's Play, Learning how We Walk,* is *not*
3. Biomechanics 7
   The whole problem of neuropathic feet is *really one of mechanics, not of medicine*
4. Great Toe 13
   It is apt to call it "Great toe" rather than calling it "Big toe"
5. Heel 16
   Heel ulcers do not heal easily!
6. Examination of Feet 21
   All that you need is *a pair of sensible hands and eyes*
7. Classification and Staging 24
   Some day yet, the ideal classification should ring the bell

SECTIONTWO: NEUROPATHIC FOOT

8. Etiopathogenesis of Neuropathic Ulcers 29
   Plantar ulcers do not occur overnight. Damage begins inside the foot and surface afterwards
9. Sharp Injuries 31
   Speaking bluntly, sharps can harm like hell
10. Shoe Bite 35
    Of course, protect shoes do, but not infrequently shoes do hurt too
11. Rat Bite 38
    Neuropathic patients should have cats as pets and not dogs
12. Thermal Injury 40
    With insensate feet, one can even walk on fire!
13. Bullosum Diabeticorum 44
    Bulla is *a natural sterile dressing as long as* it is *intact*
14. Lateral Malleolar Bursitis 47
    The price of sitting cross legged
15. Fissures (Cracks) 49
    Fissures result from draught of the plantar skin
16. Intrinsic Minus Foot 51
    Small muscle loss leads to large structural defect
17. Deformities 53
    Deformities are surrogate markers of raised plantar pressure
18. Limited Joint Mobility (LJM) 58
    Foot is no more supple and resilient

19. Plantar Callus 60
We should not be callous towards a Callus
20. Charcot Foot 63
In extreme cases, the foot is *like a bag of loose bones*
21. Local Gigantism 68
Gulliver among Lilliputians
22. Lessons from Leprosy Foot 69
We owe our understanding of diabetic foot ulcers to *foot ulcers of leprosy*
23. Plantar Ulcers, Management Principles 72
Antibiotics and dressings do not heal plantar ulcers. It is *the off-loading that heals them!*

SECTIONTHREE: NAIL AND SKIN LESIONS

24. Nail Lesions 85
Nail is *an asset, a protective toe cap. In high-risk foot,* it is *often a liability*
25. Diabetic Dermopathy 88
A cutaneous marker of diabetes
26. Necrobiosis Lipoidica Diabeticorum 89
Ulcerated lesions do not heal so *easily*

SECTION FOUR: INFECTED NEUROPATHIC FOOT

27. Etiopathogenesis and Diagnosis of Foot Infection 93
It is *the nose and not the eyes which brings foot infection* to *notice*
28. Non-Limb Threatening Infection 97
Caution: One thing can lead to *another*
29. Management of Non-Limb Threatening Infection 99
Rein it *in well before* it *gallops*
30. Limb Threatening Infection 102
Danger: Limb today, Life tomorrow
31. Management of Limb Threatening Infection 105
Body moans for the losing limb
32. Necrotizing Fascitis 115
It *spreads like a wild fire*
33. Life Threatening Infection 118
One had better lose a limb to *earn fresh life*

SECTION FIVE: NEUROISCHEMIC FOOT

34. Clinical Signs and Symptoms of Ischemia 125
Cold and Bald, Painful but Pulseless
35. Medial Arterial Calcification (Monckeberg's Sclerosis) 129
Vessels are like a "Lead-pipe"
36. Evaluation of Neuroischemic Foot 131
Pray the amputation guillotine falls less often

37. Management of Neuroischemic Foot 135
Prior to a major amputation, always consult a vascular surgeon

SECTION SIX: AMPUTATION

38. Gravity of the Problem of Leg Amputation 147
Missed only when lost
39. Minor and Major Amputations 149
The surgen), even) surgeon hates to perform
40. Rehabilitation of the Amputee 162
After amputation, life is *not normal, But whose life is!*

SECTION SEVEN: PREVENTION OFTHE DIABETIC FOOT

41. Life Long Surveillance of the High-risk Feet 169
Preserve the intact skin, use the feet sparingly
The patients need to love their feet
42. Preventive Footwear 171
Out of shape footwear means an out of shape foot. If footwear is *loose,* it *has little lise*
43. Diabetic Foot Clinic and Team Approach 176
Team work makes everything possible even the impossible
44. Patient Education 178
Of all the approaches to saving the diabetic foot, the most important is *patient education*

SECTION EIGHT: OTHER ASPECTS

45. Learning from Failures 183
Behind every success there is *failure*
46. Maggots (Larval Therapy) 188
Crawly little creatures, come useful too!
47. Newer Dressings 190
Still waters run deep
48. Newer Therapies 192
Promising but cannot substitute fundamentals of management
Bibliography 195
Abbreviations 197
Index 199
