Video Contents*

Chapter 2. COMMENTARY 2A: Seizure Diagnosis and Evaluation in the Era of Coronavirus Disease 2019

Amit Halder, Ambar Chakravarty

VIDEO 2.1: A 65-year-old lady with COVID19 infection presented with abnormal perioral and facial dyskinetic movements. The patient was responsive during these movements. Patient was referred as a case of new onset seizure. But the video suggested otherwise. A careful history confirmed previous history of milder forms of similar movements. MRI of brain was normal and the movements decreased after 72 hours confirming it to be a transient exacerbation of a pre-existing dyskinesia possibly tardive, although there was no history of treatment with anti-psychotic drugs (**34**)

Chapter 4. Unusual Seizures: Which May Not Look Like Seizures

Nitika Mahajan, Gagandeep Singh

VIDEO 4.1: Asymmetric tonic seizures arising presumably from the supplementary motor area. Laparoscopic dermoid cyst (**58**)

VIDEO 4.2: Hypermotor seizures with bipedal cycling movements lasting for a very short period of time and minimal post ictal confusion. The patient had several episodes during night. The seizures resolved after lesionectomy involving the right fronto polar region (**58**)

VIDEO 4.3: Ictal pouting also known as "Chapeau De Gendarme" in a patient with seizure arising presumably from cingulate gyrus (**60**)

VIDEO 4.4: Dominant (left) temporal lobe seizure during which testing disclosed a post-ictal aphasia consistent with the localization (**61**)

VIDEO 4.5: Ictal speech as shown in the video in which the patient speaks legibly during the seizure is however, lateralized to nondominant temporal lobe (**61**)

VIDEO 4.6: Typical faciobrachial dystonic seizure in a patient with confirmed LG1A autoimmune encephalitis (**62**)

VIDEO 4.7: Myoclonic seizures in a patient with juvenile myoclonic epilepsy (**62**)

VIDEO 4.8: Video showing typical limb myoclonus during absence seizures in a patient with epilepsy with myoclonic absences (**63**)

VIDEO 4.9: Self-induced photic seizures (**64**)

VIDEO 4.10: Paroxysmal kinesigenic dyskinesia precipitated by movement. This is not itself a seizure but an unusual differential diagnosis (**64**)

Chapter 6. COMMENTARY 6A: The Three Musketeers: Great Mimickers of Epileptic Seizures

Ambar Chakravarty

VIDEO 6.1: Intermittent shaking of left hand in this elderly man with tight carotid stenosis, only on assuming erect posture: Suggestive of limb shaking TIAs (**99**)

Chapter 9. Movement Disorder Mimics of Epileptic Seizures

Asha Kishore, Roopa Rajan (Video provided by the Editor, Dr Ambar Chakravarty)

VIDEO 9.1: Status dystonicus in a 8 years old child with DYT1 TOR1A (Exon5) mutation. The child is conscious throughout the spell of painful spasm lasting for >40 minutes, several times a day (**167**)

COMMENTARY 9A: Epilepsy and Movement Disorders: The Other Side of the Coin and Beyond

Ambar Chakravarty

VIDEO 9.2: A 90 years old lady with advanced Alzheimer disease and intercurrent infection having epilepsy partialis continua in her right upper limb. This may be mistaken for asterixis (because of the myoclonic element) or ballistic movements. The abnormal movements were controlled with intravenous levetiracetam. The MRI of brain did not show any corresponding focal lesion (**171**)

COMMENTARY 9B: Psychogenic Nonepileptic Seizures and Psychogenic Movement Disorders – Are They Really Different?

Ambar Chakravarty

VIDEO 9.3: 58 years old lady with psychogenic movement disorder comprising of coarse tremor of varying frequency in head and hands, startle response and vocalization to a sound stimulus. To note the la belle indifference attitude and the smile (**178**)

Chapter 11. COMMENTARY 11D : The Problem of Coexisting Epileptic and Nonepileptic Seizures

Ambar Chakravarty

VIDEO 11. 1 AND 11.2: Videograph of the patient during VEEG recording. Note the "attacks" with motor activity of the legs and frothing from mouth. He was also incontinent. The EEG althrough remained normal except for movement related artifacts. No epileptiform features noted in the "ictal" record (**230**)

Chapter 15. Mimics of Epileptic Seizures in Pediatric Practice

Neelu Desai, Vrajesh Udani

VIDEO 15.1: Benign neonatal infantile myoclonus (**258**)

VIDEO 15.2: Hypereklepsia (**258**)

VIDEO 15.3: Shuddering spell (**259**)

**The videos are available on www.emedicine360.com.*

Chapter 22. Utility and Pitfalls of Video-electroencephalography in Diagnosis of Difficult and Unusual Epileptic Seizures
Ashalatha Radhakrishnan
VIDEO 22.1: Classical frontal lobe seizure (**355**)
VIDEO 22.2: An instance of occipital lobe epilepsy (**355**)
VIDEO 22.3: A condition dominated by tonic seizure called Lennox–Gastaut syndrome (**356**)
VIDEO 22.4: A case of nonepileptic syndrome in children (**356**)
VIDEO 22.5: Case of juvenile myoclonic epilepsy (**357**)
VIDEO 22.6: Phantom absences (**357**)
VIDEO 22.7: Perioral myoclonia with absences (**357**)
VIDEO 22.8: Neck myoclonia with absences (**357**)
VIDEO 22.9: Jeavons syndrome – case of eyelid myoclonia with absences (**357**)
